DATE MAILED: 11/03/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

		Application No.	Applicant(s)				
Office Action Summary		09/484,691	EBRAHIMI ET AL.				
		Examiner	Art Unit				
		Carl Colin	2136				
	The MAILING DATE of this communication appears on the cover sheet with the correspondence address						
Period for Reply							
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.  - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.  - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.  - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.  - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).  - Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).							
Status	December to communication(s) filed on 22 A	Luguet 2005					
1)⊠	Responsive to communication(s) filed on 22 A						
2a)⊠	, —	s action is non-final.	accoution on to the morite is				
3)	3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under <i>Ex parte Quayle</i> , 1935 C.D. 11, 453 O.G. 213.						
Dispositi	on of Claims						
4) 🖂	Claim(s) <u>1-31</u> is/are pending in the application						
•	4a) Of the above claim(s) is/are withdrawn from consideration.						
5) 🗌	Claim(s) is/are allowed.						
6)⊠	Claim(s) <u>1-31</u> is/are rejected.						
7)	Claim(s) is/are objected to.						
8) Claim(s) are subject to restriction and/or election requirement.							
Application Papers							
9) The specification is objected to by the Examiner.							
10) The drawing(s) filed on <u>01/18/2000</u> is/are: a) accepted or b) objected to by the Examiner.							
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  11) The proposed drawing correction filed on is: a) approved b) disapproved by the Examiner.							
If approved, corrected drawings are required in reply to this Office action.							
12) The oath or declaration is objected to by the Examiner.							
Priority under 35 U.S.C. §§ 119 and 120							
13) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).							
a) ☐ All b) ☐ Some * c) ☐ None of:							
1. Certified copies of the priority documents have been received.							
	2. Certified copies of the priority documents have been received in Application No						
3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).							
* See the attached detailed Office action for a list of the certified copies not received.							
14) Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).							
a) ☐ The translation of the foreign language provisional application has been received. 15)☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

## DETAILED ACTION

## Response to Arguments

- 1. In response to communications filed on 8/22/2005, applicant amends claims 1, 14, 23, and 27. The following claims 1-31 are presented for examination.
- 2. Applicant's arguments, see pages 9-12, filed on 8/22/2005, with respect to the rejection of claims 1-31, under 35 USC 103 (a) have been fully considered but they are not persuasive as amended. Applicant has amended the independent claims 1, 14, 23, and 27 to further recite that "the policy module and the transparent proxy reside within the same environment". Applicant has not overcome the rejection by amending the claims because Green discloses a transparent proxy comprising a connection manager and a security manager that meets the recitation of policy module residing within the same environment with the transparent proxy (see figure 3b and column 5, lines 34-40), that can securely monitor and control communication between the client and the server in accordance with a defined security policy (column 5, lines 15-32). The client transfers data request to the proxy, requesting information from a server, the proxy comprises modules and components wherein a connection manager operates with a security monitor which monitors the data from the client for conformance with predefined conditions and provides control information to the connection manager of the proxy which in turns controls the relay and directs it whether to establish connections to the server (see column 8, lines 14-25). Examiner maintains the rejection of claims 1-31 under 103(a) in view of the same references.

Application/Control Number: 09/484,691

Art Unit: 2136

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Page 3

- Claims 1-3, 7-8, 9-17, and 20-28 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 6,401,125 to Makarios et al in view of US Patent 6,003,084 to Green et al.
- 3.2 As per claims 1, 14-17, Makarios et al substantially teaches a method for brokering state information exchanged between computers using at least one protocol above a transport layer, the method comprising the steps of receiving at a proxy a request from a client requesting a resource of an origin server wherein the transparent proxy is unknown to the client (column 4, lines 53-56) the proxy disclosed meets the recitation of transparent proxy as the proxy is unknown to the client as the client sends the URL directly to a server. Makarios et al discloses redirecting the client request from the proxy to a signup web page with an address that meets the recitation of policy module with identifier of claim 14 (column 4, lines 51-53 and column 5, lines 10-15); obtaining enforcement data provided by the policy module (column 5, lines 15-27 and

column 3, lines 1-10); a proxy cookie is generated in response to login information of the user and transmitting to the user to use as an authentication for further interactions with the proxy that meets the recitation of generating at the proxy a policy state token in response to the policy enforcement data (column 5, lines 19-51); and transmitting the policy state token from the proxy to the client wherein the policy state token is used as an authentication of the client to the transparent proxy for subsequent interactions between the client and the transparent proxy. Although Makarios et al discloses the claimed method steps of claim 1, Makarios et al does not provide enough details on the architecture implemented in the invention. Green et al in an analogous art teaches a memory configured at least in part by a transparent proxy process, a processor for running the transparent proxy process, (see figure 1) at least one link for networked communication between the transparent proxy process, on the one hand, and a client computer and an origin server, on the other hand, for example (see figures 2 and 3); Green et al further teaches a secure transparent proxy that is transparent to both a client and a server (column 9, lines 5-12) and transmitting packets in accordance with a defined security policy (column 5, lines 25-30) having a security module to verify whether to grant or deny access to proxy services (column 7, line 48 through column 8, line 25 and column 9, line 12-67). Green et al discloses a transparent proxy comprising a connection manager and a security manager that meets the recitation of policy module residing within the same environment with the transparent proxy (see figure 3b and column 5, lines 34-40). In one embodiment, the proxy comprises a connection manager and a security manager that meets the recitation of policy module residing within the same environment with the transparent proxy (see figure 3b and column 5, lines 34-40), the proxy incorporates features of both application gateways and proxies to better serve client or the

server depending on which side caused the firewall action to be triggered; and further discloses several advantages of the invention associated with the transparent proxy (column 5, lines 55 through column 6, line 20). Green et al discloses wherein policy enforcement data is received from the policy module because as the client transfers data request to the proxy, requesting information from a server, the proxy comprises modules and components wherein a connection manager operates with a security monitor which monitors the data from the client for conformance with predefined conditions and provides control information to the connection manager of the proxy which in turns controls the relay and directs it whether to establish connections to the server (see column 8, lines 14-25). In another embodiment, the proxy uses a filter component that also meets the recitation of policy module, and the filter component processes the policy enforcement data an returns status to the communication component of the proxy, based on the status, the proxy communicates accordingly to the server (see column 10, lines 28-47). Therefore, it would have been obvious to one of ordinary skilled in the art at the time the invention was made to modify the invention of Makarios et al to implement some of the features of the inventive concept of Green et al, which provides a transparent proxy comprising security modules with more security and more versatility as taught by Green et al. One skilled in the art would have been motivated to do so because the transparent proxy disclosed by Green et al is transparent to both the client and the server, incorporating features of both application gateways and proxies, easy to configure, (see column 5, line 55 through column 6, line 20), it also provides more security and more versatility where additional filtering may be performed as desired, and it is associated with policy module that allows the proxy to use any

defined protocols in accordance to defined security policy and provides transparency wherein no devices need to change any configuration information (column 9, lines 11-60).

As per claims 2-3, Makarios et al discloses the limitation of receiving at the proxy a renewed request for the origin server resource, the renewed request containing the policy state token, wherein the renewed request contains the policy state token in a cookie in a header sent from the client to the proxy, for example (column 5, lines 25-32).

As per claims 7-8, Makarios et al teaches the limitation of wherein HTTP or HTTPS is a protocol used during at least one of the receiving and transmitting steps (column 3, lines 30-67).

As per claim 10, the combination of Makarios et al and Green et al teaches directory access protocol for authentication of client that meets the recitation of utilizing LDAP as a software to provide authentication information about the client and the transparent policy enforcement data obtained by the transparent proxy depends on the authentication thus provided (Green et al, column 9, lines 12-47). Therefore, claim 10 is rejected on the same rationale as the rejection of claim 1.

Claims 9 and 11 are similar to the rejected claim 10 except for utilizing Novell Directory Services and SSL software respectively instead of LDAP. Green et al discloses other directory service protocols and any protocols used in X400's X500's. Therefore using NDS or

SSL would have been obvious to one skilled in the art, as these protocols are well known.

Therefore, claims 9 and 11 are rejected on the same rationale as the rejection of claim 1.

As per claim 12, Makarios et al. teaches the limitation of wherein the obtaining step extracts policy enforcement data from a redirection address field (see column 3, lines 1-10).

As per claim 13, Makarios et al. teaches the limitation of wherein the transmitting step transmits the policy state token in a cookie in a header sent from the proxy to the client (column 10-32).

As per claims 20-22, claim 20 adds another proxy with similar limitations as the rejected claim 14. To one with ordinary skilled in the art, the network can comprise of any number of clients and servers and adding more than one proxy to share some of the functions would have been a design choice and obvious to one skilled in the art because assigning proxies to handle specific functions or protocols is well known in the art.

Claims 23 and 28 recite some of the limitations found in claim 1 except for implementing the claimed method in a computer system and for using a first signal including a redirection command which specifies the policy module address as a redirection target (see Makarios et al, column 5, lines 10-25); and a second signal including a redirection command which specifies the transparent proxy server address as a redirection target (Makarios et al, column 5, lines 30-32). Makarios et al discloses a signup web page with an address that meets

the recitation of policy module address. Green and al discloses the amended limitations of claim 23 as discussed in claim 1 above. Therefore, claims 23 and 28 are also rejected on the same rationale as the rejection of claim 1.

As per claim 24, Makarios et al teaches the limitation of wherein the first signal includes an identity broker address as the policy module address (see column 5, lines 10-25).

As per claim 25, Makarios et al teaches the limitation of wherein the first signal includes a login server address as the policy module address (see column 5, lines 10-25).

As per claim 26, Makarios et al teaches the limitation of wherein the second signal includes the policy enforcement data embedded in an address field with the transparent proxy server address (see column 5, lines 10-25).

Claims 27 is similar to the rejected claim 1, except for incorporating the claimed method of claim 1 into a computer medium. Therefore, claim 27 is rejected on the same rationale as the rejection of claim 1.

Claims 4, 6, 18, 19, 29, and 30 are rejected under 35 U.S.C. 103(a) as being unpatentable 4. over US Patent 6,401,125 to Makarios et al in view of US Patent 6,003,084 to Green et al as applied to claims 1-3 above and further in view of US Patent Publication US 2002/0007317 to Callaghan et al.

Page 9

As per claim 6, Callaghan et al. teaches further comprising the steps at the proxy of forwarding to the client at least a portion of a communication from the origin server, and forwarding to the origin server at least a portion of a communication from the client (page 5, paragraphs 81-82). Therefore, claim 6 is rejected on the same rationale as the rejection of claim 4.

to customize request and response as it fits to the proxy (page 4, paragraphs 61-62).

Claim 18 recites some of the limitations of claims 1 and 4 as discussed above. For instance, Green et al discloses transparent proxy service that is transparent to both client and

server, the combined references above also teach the step of accepting the authorization from the client with a renewed client request for the origin server resource; forwarding the renewed client request to the origin server without forwarding the authorization but with an indication to the origin server that the transparent proxy server is the source of the forwarded request, and then transparently forwarding the requested resource from the origin server to the client as mentioned in claims 1 and 4. Therefore claim 18 is rejected on the same rationale as the rejection of claims 1 and 4.

As per claim 19, Makarios et al teaches the limitation of wherein the transparent proxy server sends the client the authorization by sending the client a proxy cookie for use in subsequent communications from the client, for example (see column 5, lines 19-51).

Claims 29 and 30 recite some of the limitations found in claim 18, therefore they are rejected on the same rationale as the rejection of claim 18.

5. Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 6,401,125 to Makarios et al in view of US Patent 6,003,084 to Green et al, in view of US Patent Publication US 2002/0007317 to Callaghan et al as applied to claim 4 above and further in view of US Patent 5,805,803 to Birrell et al.

As per claim 5, Makarios et al discloses an example of reply containing an origin state token for use by the proxy in its subsequent communications with a (column 5, lines 55-65). It is

Application/Control Number: 09/484,691

Art Unit: 2136

obvious to one skilled to the art that the same concept can be applied in the server side (see figure 2) as the proxy is capable of saving the cookie for future interactions with the server.

Green et al discloses transparency with both the server and the client and discloses interaction between the proxy and the server (column 11, lines 5-17). Birrell et al. in an analogous art discloses receiving at the proxy a reply from the origin server, the reply containing an origin state token for use by the proxy in its subsequent communications with the origin server, for example (see column 4, lines 51-65). Therefore, it would have been obvious to one of ordinary skilled in the art at the time the invention was made to modify the method as combined above to include the step of receiving at the proxy a reply from the origin server, the reply containing an origin state token for use by the proxy in its subsequent communications with the origin server. One skilled in the art would have been motivated to do so because using the origin state token for use by the proxy in its subsequent communications with the origin server will allow the proxy to save in time and bandwidth if the server is already known to the server rather than authenticating at every session (column 4, lines 51-65 and 13-26).

Page 11

6. Claim 31 is rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 6,401,125 to Makarios et al in view of US Patent 6,003,084 to Green et al as applied to claim 27 above and further in view of US Patent Publication US Patent 6,728,884 to Lim.

As per claim 31, both references substantially teach the step of generating at the proxy a policy state token in response to the policy enforcement data (Makarios et al, column 5, lines 19-51); transmitting the policy state token from the proxy to the client (Makarios et al, column

5, lines 19-51); receiving the proxy cookie from the client with a renewed client request for the origin server resource (Makarios et al, column 5, lines 19-51), and redirecting client request from a transparent proxy to a policy module and accepting the policy enforcement data (Makarios et al, column 5, lines 19-51). Neither of the references explicitly teach redirecting a request from a second transparent proxy to be to, and accepting the policy enforcement data at the second transparent proxy. To a person skilled in the art it is apparent that the proxy disclosed by the combined references above can be implemented in more than one computer to obtain a second transparent proxy that will perform the same function. Load balancing is well known in the art; and in load balancing, another transparent proxy or gateway can perform a specific function when the first one is not available. Lim in an analogous art teaches a plurality of proxy servers associated with several security modules to control and provide access to resources (column 3, lines 40-57). Lim discloses proxy configuration data that specifies the configuration of each proxy servers; the proxy configuration data specifies whether a particular proxy security server provides authorization services (column 6, line 65 through column 7, line 5) and discloses request can be received by a specific proxy server since the request may include data that indicates which proxy servers to use and further discloses proxy server requests security module (column 5, lines 60-67 and column 6, lines 15-20); a returned cookie is required for access to resources (column 6, lines 34-35) and further discloses that not all the proxies may provide the same set of services a service may be available for a specific service while another server provides that particular service (column 8, lines 59-67) that meets the recitation of accepting at the second transparent proxy the second policy enforcement data provided by the policy module, the second policy enforcement data including authorization from the policy module for the client

to access the resource through the second transparent proxy. Therefore, it would have been obvious to one of ordinary skilled in the art at the time the invention was made to modify the method as combined above to include a second transparent proxy where a request can be received after the first proxy becomes unavailable and accepting at a second proxy policy enforcement data from policy module for authorization to access resources as suggested by Lim. One skilled in the art would have been motivated to utilize more than one proxy because it provides the advantage of governing access to more information resources and selective proxies can be assigned to specific security policies and if there is a need for reconfiguration other proxies will be available (see column 2, lines 27-36) as suggested by Lim.

## Conclusion

7. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
